Fisheries and Oceans | Pêches et Océans

Canada

Canadian Data Report of
Fisheries and Aquatic Sciences

Data reports provide a medium for filing and archiving data compilations where little or no analysis is included. Such compilations commonly will have been prepared in support of other journal publications or reports. The subject matter of data reports reflects the broad interests and policies of the Department of Fisheries and Oceans, namely, fisheries and aquatic sciences.

Data reports are not intended for general distribution and the contents must not be referred to in other publications without prior written authorization from the issuing establishment. The correct citation appears above the abstract of each report. Data reports are abstracted in *Aquatic Sciences and Fisheries Abstracts* and indexed in the Department's annual index to scientific and technical publications.

Numbers 1 - 25 in this series were issued as Fisheries and Marine Service Data Records. Numbers 26 - 160 were issued as Department of Fisheries and the Environment, Fisheries and Marine Service Data Reports. The current series name was introduced with the publication of report number 161.

Data reports are produced regionally but are numbered nationally. Requests for individual reports will be filled by the issuing establishment listed on the front cover and title page. Out-of-stock reports will be supplied for a fee by commercial agents.

Rapport statistique canadien des
sciences halieutiques et aquatiques

Les rapports statistiques servent à classer et à archiver les compilations de données pour lesquelles il y a peu ou point d'analyse. Ces compilations auront d'ordinaire été préparées à l'appui d'autres publications ou rapports. Les sujets des rapports statistiques reflètent la vaste gamme des intérêts et des politiques du ministère des Pêches et des Océans, c'est-à-dire les sciences halieutiques et aquatiques.

Les rapports statisiques ne sont pas destinés à une vaste distribution et leur contenu ne doit pas être mentionné dans une publication sans autorisation écrite préalable de l'établissement auteur. Le titre exact paraît au-dessus du résumé de chaque rapport. Les rapports statisiques sont résumés dans la revue *Résumés des sciences aquatiques et halieutiques*, et ils sont classés dans l'index annuel des publications scientifiques et techniques du Ministère.

Les numéros 1 à 25 de cette série ont été publiés à titre de relevés statistiques, Services des pêches et de la mer. Les numéros 26 à 160 ont été publiés à titre de rapports statistiques du Service des pêches et de la mer, ministère des Pêches et de l'Environnement. Le nom actuel de la série a été établi lors de la parution du numéro 161.

Les rapports statistiques sont produits à l'échelon régional, mais numérotés à l'échelon national. Les demandes de rapports seront satisfaites par l'établissement auteur dont le nom figure sur la couverture et la page du titre. Les rapports épuisés seront fournis contre rétribution par des agents commerciaux.

ABSTRACT

Morris, J. F. T., Trudel, M., Thiess, M. E., Zubkowski, T. B., and MacLean, H. R. 2007. *CFV Frosti* Gulf of Alaska salmon survey, June 28 - July 7, 2005. Can. Data Rep. Fish. Aquat. Sci. 1187: 125 p.

The Highseas Salmon program of Fisheries and Oceans Canada conducted a survey of Pacific salmon in the Gulf of Alaska from June 28 to July 6, 2005 on the *CFV Frosti*. The objectives of the survey were to (1) evaluate the distribution and ecology of juvenile Pacific salmon (*Oncorhynchus spp.*) during their first year in the ocean, (2) describe the ambient oceanographic conditions, and (3) quantify the biomass of zooplankton. Fish, oceanographic, and zooplankton sampling was conducted at stations ranging from the west coast of Vancouver Island to Forrester Island off Southeast Alaska (54.79 ° N).

A total of 4339 Pacific salmon were caught on the survey. Of these, 2893 were juvenile pink salmon (*O. gorbuscha*), 836 were juvenile chum salmon (*O. keta*), 252 were juvenile sockeye salmon (*O. nerka*) and 114 were juvenile coho salmon (*O. kisutch*) in their first summer (age X.0) in the ocean and 15 were chinook salmon (*O. tshawytscha*) under 350 mm in fork length.

Juvenile pink, chum , and sockeye were abundant along their migration pathway through Queen Charlotte Sound, Hecate Strait, Dixon Entrance, and on the shelf off Southeast Alaska. Juvenile coho and chinook less than 350 mm in fork length were more dispersed over the range of the survey.

Juvenile pink, chum, sockeye, and coho averaged were 117, 130,134, and 193 mm in fork length, respectively. Juvenile sockeye and coho were significantly greater in size in Dixon Entrance and on the shelf off Southeast Alaska, which supports the hypothesis that fast growing juvenile salmon migrate north at a faster rate.

All 10 juvenile salmon with coded wire tags (CWT's) that were recovered on this survey were caught off the west coast of Vancouver Island, and all had originated from the Columbia - Snake River system. These included 6 juvenile chinook (age 1.0) and 4 juvenile coho (age 1.0). In addition, one CWT chinook (age 0.1) that was in its second year at sea was also recovered off the west coast of Vancouver Island, and it came from the Big Qualicum hatchery on Georgia Strait in southern British Columbia

RÉSUMÉ

Morris, J. F. T., Trudel, M. Thiess, M. E., Zubkowski, T. B., et MacLean, H. R. 2007. Campagne d'évaluation des saumons dans le Golfe de l'Alaska à bord du *CFV Frosti* entre le 28 juin et le 7 juillet 2005. Can. Data Rep. Fish. Aquat. Sci. 1187: 125 p.

Le programme canadien des Saumons en Haute Mer de Pêches de Océans Canada a affrété un chalutier commercial, le *CFV Frosti*, pour mener une étude sur les saumons du Pacifique dans le Golfe de l'Alaska entre le 28 juin et le 6 juillet novembre 2005. Les objectifs de cette étude était de (1) évaluer la distribution et l'écologie des saumons du Pacifique (*Oncorhynchus* spp.) juvéniles durant leur première année en mer, (2) décrire les conditions océanographiques ambiantes, et (3) quantifier la biomasse de zooplancton. Nous avons mesuré les conditions océanographiques et échantillonné le zooplancton et les poissons à des stations situées entre la côte ouest de l'Île de Vancouver jusqu'à l'Île de Forrester dans le sud-est de l'Alaska (54.79 ° N).

En tout, 4339 saumons du Pacifique ont été capturés durant cette étude, incluant : 2893 saumons roses (*O. gorbuscha*) juvéniles, 836 saumons kétas (*O. keta*) juvéniles, 252 saumons rouges (*O. nerka*) juvéniles, 114 saumons coho (*O. kisutch*) juvéniles durant leur premier été en mer (âge X.0), et 15 saumons quinnats (*O. tshawytscha*) ayant une longueur à la fourche inférieure à 350 mm.

Les saumons juvéniles roses, kétas et rouges étaient abondants le long de leur couloir de migration qui comporte le Détroit de la Reine Charlotte, le Détroit de Hécate, le Détroit de Dixon et le plateau continental du sud-est de l'Alaska. Les saumons coho juvéniles et les saumons quinnats ayant une longueur à la fourche inférieure à 350 mm étaient plus dispersés sur toute l'aire d'échantillonnage.

Les saumons juvéniles roses, kétas, rouges et cohos mesuraient en moyenne 117, 130, 134, et 193 mm (longueur à la fourche). Les saumons juvéniles rouges et cohos avaient une taille significativement plus élevée dans le Détroit de Dixon et sur le plateau continental du sud-est de l'Alaska, ce qui supporte l'hypothèse selon laquelle les saumons juvéniles qui ont une croissance plus rapide migrent également plus rapidement vers le nord.

Les 10 saumons juvéniles marqués à l'aide d'un CWT qui ont été récoltés durant cette étude, dont 6 saumons quinnats juvéniles (âge 1.0) et 4 saumons cohos juvéniles (âge 1.0), ont tous été capturés sur la côte ouest de l'Île de Vancouver et provenaient du complexe de la Rivière Columbia et de la Rivière Snake. De plus, nous avons également capturé sur la côte ouest de l'Île de Vancouver un saumon quinnat (âge 0.1) qui en était à sa deuxième année en mer. Ce saumon provenait de la pisciculture de la Rivière Big Qualicum dans le Détroit de Georgie au sud de la Colombie-Britannique.

INTRODUCTION

The Highseas Program of Fisheries and Oceans Canada has conducted annual Pacific salmon surveys in the Gulf of Alaska since 1995 [1-25]. The main objectives of these surveys were to collect information on (1) the distribution and ecology of Pacific salmon (*Oncorhynchus spp.*) during their ocean phase, (2) the ambient oceanographic conditions, and (3) the distribution and biomass of zooplankton.

This report documents the data collected for the survey completed from June 28 to July 7, 2005. The survey design comprised fish, oceanographic and zooplankton sampling from the west coast of Vancouver Island to Southeast Alaska.

MATERIALS AND METHODS

General Survey Information

Figures 1, 2, and 3 show the fishing, oceanographic and zooplankton stations, respectively, completed by the *CFV Frosti* on the June 28 - July 7, 2005 survey. A total of 39 fishing stations, 39 oceanographic stations, and 36 zooplankton stations were completed.

The survey conducted scientific operations off the west coast of Vancouver Island, in Queen Charlotte Sound, in Hecate Strait, in Dixon Entrance, and on the shelf off Southeast Alaska. Three of four of the Highseas Salmon program's standard cross-shelf transects were completed: the Estevan Point transect on the west coast of Vancouver Island, the Hecate Strait transect, and the Forrester Island transect off Southeast Alaska Unfortunately, we completed just two stations on the Triangle Island transect in Queen Charlotte Sound, before storm warnings and time restrictions forced its cancellation. In addition to these transects, scientific operations were conducted along the beach from Langara Island to Rose Spit in Dixon Entrance, and along the beach off northern Vancouver Island.

Fishing Gear and Fishing Operations

The survey was conducted on the *CFV Frosti* a 39 m that is a commercial stern trawler that is powered by a 1190 H.P. diesel engine. The *CFV Frosti* towed a mid-water trawl, originally manufactured by Cantrawl Nets Ltd., Richmond, BC, and later modified to a model 240 trawl. It has a heavy-duty front end of hexagonal web made from 3/8 in. (9.5 mm) and 5/16 in. (7.9 mm) Tenex rope, and a tapered body made-up of 64 in. (163 cm), 32 in. (81.3 cm), 16 in. (40.6 cm), 8 in. (20.3 cm) and 4 in. (10.2 cm) polypropylene sections, an intermediate section of 3 in. (7.6 cm) polypropylene, and a codend of 1.5 in. (3.8 cm) knotted nylon lined with 0.25 in. mesh (64 mm). The trawl has three 40 m bridles of 5/8 in. (1.6 cm) wire rope per side that were attached with a single hook-up to Thybron 104 doors. To increase floatation and to serve as a visibilty aid to assess the performance of the trawl, four round floats were tied along the the head rope: one at each side of the kite at the center and one at each wing tip. The

CFV Frosti towed the trawl at the surface at approximately 4 to 5 knots (2.6 m s^{-1}) with 200 m of warp.

Oceanographic Sampling

At oceanographic stations, the scientific crew (1) conducted CTD (conductivity-temperature-depth) casts, (2) collected seawater samples at 10 m from the surface with a Niskin bottle for nitrate, phosphate, silicate, and salinity, and (3) filtered surface seawater on GF/F glass fibre filter disks for chlorophyll *a*.

Nitrate, phosphate, and silicate samples were collected in acid-washed glass test tubes, and the glass fiber disks were folded and placed in polypropylene scintillation vials. All these samples were stored frozen.

CTD casts were routinely conducted to 250 m or within 5 m of the bottom with a portable Seabird SBE 19 probe. Several calibration samples from selected CTD casts were collected over the course of the survey with Niskin bottles at deeper depths where the salinities were stable.

Zooplankton Sampling

At zooplankton stations, vertical bongo tows to approximately 150 m or within 10 m of the bottom were conducted with two 57 cm diameter, 253 μm Nitex nets. One of the nets was equipped with a flowmeter.

Zooplankton collected from the net with the flowmeter were preserved in 10% formalin and sent to the zooplankton laboratory at the Institute of Ocean Sciences, Fisheries and Oceans Canada (Sidney, BC) for species classification and enumeration. Zooplankton taken from the net without flowmeter were sorted into four size fractions by successively sieving through 8.0, 1.7, 1.0, and 0.25 mm screens. Each size fraction was weighed wet, dried at 60°C for 48 hours, re-weighed, and stored in plastic bags for future stable isotope, bomb calorimetry, and proximate analyses.

RESULTS

Salmon Catch Data

Table 1 and 2 report information on trawl tows and a summary of Pacific salmon catches for this survey. Tow information includes: station ID, transect name, sampling region, date and time, start latitude (°N) and longitude (°W), heading (°T; degrees true), and bottom depth (m). Station ID numbers consisted of the Pacific Biological Station cruise designation ("HS200517", where HS stands for High Seas), followed by a tow number (e.g., "HS200517-IVI01" for a tow #1 inside the inlets on the west coast of Vancouver Island, British Columbia). The station ID number serves as the primary key in the High Seas salmon database that links fishing tow information with the oceanographic and zooplankton tables.

For each tow, catch totals are provided for all chinook salmon (*O. tshawytscha*) ("CK") that includes all ages and size classes, and separately for juveniles and adults of chum salmon (*O. keta*) ("CM"), coho salmon (*O. kisutch*) ("CO"), pink salmon (*O. gorbuscha*) ("PK"), and sockeye salmon (*O. nerka*) ("SE"). In this report, "juveniles" are defined as fish in their first summer in the ocean (age X.0+), while "adults" include all older age groups (age X.1+ or older). Age separation was determined based on examination of size distributions (fork length) which showed non-overlapping size modes for chum, coho, pink, and sockeye salmon. Chinook salmon were not divided into juveniles and adults based on size since there is considerable overlap among size modes that represent the multiple age groups.

The abbreviations for the regions in the tables are:

SEA	Southeast Alaska
DE	Dixon Entrance
HS	Hecate Strait
QCSD	Queen Charlotte Sound
VI	West coast Vancouver Island

Biological Data

Table 3 reports the detailed biological data collected from each Pacific salmon caught during the survey. Individual salmon were assigned a fish number which consisted of the cruise identifier (e.g., "HS200517"), followed hierarchically by tow number, species code, and sample number. For example, "HS200517-DE01-124-001" refers to tow number DE01 or tow #1 in Dixon Entrance, species code "124" for chinook salmon, and the sample number "001" (within tow and species). We used the following codes from Fisheries and Oceans' Salmon Stock Assessment database: 108, pink salmon; 112, chum salmon; 115, coho salmon; 118, sockeye salmon; and 124, chinook salmon.

Biological data collected for each salmon includes (when available): species common name, fork length (mm), whole body weight (g wet), sex, stomach content weight (g wet), % water (based on the ratio of dry to wet whole body weight), coded wire tag number (CWT; if present), pit tag number (if present), and observed fin clip (if present).

Juvenile Salmon Catch Distributions

Juvenile pink, chum, and sockeye were caught within the range of 1-625 fish per tow primarily along their migration pathway through Queen Charlotte Sound, Hecate Strait, Dixon Entrance, and on the shelf off Southeast Alaska (Figures 4,5, and 6). Some juvenile sockeye and chum were caught occasionally within the range of 1-5 fish per tow on the shelf off the west coast of Vancouver Island. Juvenile coho were caught throughout the survey within the range of 1-25 fish per tow (Figure 7). Juvenile chinook

under 350 mm were caught occasionally throughout the survey within the range of 1-5 fish per tow (Figures 8, 9, 10, and 11).

Size Comparisons of Juvenile Salmon Among Regions

Figure 20 shows the length frequencies for each species of salmon caught on the cruise, and figures 21 to 24 show comparisons of sizes among regions for juvenile pink, chum, sockeye, and coho, respectively. No regional comparisons of size were made for juvenile chinook of specific ocean age classes due to the considerable overlap among size modes that represent multiple age groups. Juvenile pink (age 0.0) averaged 117 mm in fork length on the survey, and did not vary significantly through Hecate Strait, Dixon Entrance, and the shelf off Southeast Alaska. Juvenile chum (age 0.0) were significantly greater in fork length in Hecate Strait than in Dixon Entrance, averaging 131 mm and 124 mm respectively ($F = 12.8$, $p<0.001$). Juvenile sockeye (age X.0) were significantly greater in fork length from south to north ($F = 22.78$, $p<0.001$), averaging 119 mm on the shelf off the west coast of Vancouver Island, 130 mm in Hecate Strait, 140 mm in Dixon Entrance and 142 mm the shelf off Southeast Alaska. Juvenile coho (age X.0) were also significantly greater in size from south to north ($F = 10.3$, $p<0.001$), averaging 184 mm on the shelf off the west coast of Vancouver Island, 199 mm in Dixon Entrance and 215 mm the shelf off Southeast Alaska.

CWT Recoveries

Table 6 reports the details on the coded wire tag (CWT) salmon caught during the survey. Reported information includes the coded wire tag number, the assigned fish number, species common name, the date and region of recovery, the fork length (mm) at capture, the release area, the name of the agency and hatchery that released the tagged fish, the brood year, and dates of first and second hatchery releases.

The abbreviations for release agencies in Table 6 are:

CDFO	Canadian Department of Fisheries and Oceans
COOP	Washington Department of Fisheries - Cooperative
NEZP	Nez Perce Tribe (ID)
YAKA	Yakama Tribe (WA)
WDFW	Washington Department of Fish and Wlidlife

The abbreviations for release areas in Table 6 are:

GST	Georgia Strait, B.C.
CRGN	Columbia River, general
LOCR	Lower Columbia River
SNAK	Snake River
UPCR	Upper Columbia River

All 10 juvenile salmon with coded wire tags (CWT's) that were recovered on this survey were caught off the west coast of Vancouver Island, and all had originated from the Columbia - Snake River system. The six juvenile chinook were stream ecotypes (age 1.0) and ranged in fork length at capture from 191 to 300 mm. The four juvenile coho (age 1.0) ranged in fork length at capture from 166 to 222 mm. In addition, one CWT chinook (age 0.1) that was in its second year at sea was also recovered off the west coast of Vancouver Island, and it came from the Big Qualicum hatchery on Georgia Strait in southern British Columbia.

Oceanographic Data

Table 4 reports the physical oceanographic data collected during the survey, including the station ID number, transect, region, the date and time in UTC, the latitude (°N) and longitude (°W), sea surface temperature (SST; °C), and salinity (SSS; ppt) taken from the CTD files, sea surface salinities (ppt) determined from the sample bottles that were used to calibrate the CTD probe, nitrate, silicate and phosphate concentrations (μmol L^{-1}), and chlorophyll *a* (μg L^{-1}).

The contact procedure to obtain the CTD files is available at:

http://www-sci.pac.dfo-mpo.gc.ca/osap/data/default_e.htm

Zooplankton Data

Table 5 reports the zooplankton data by station collected by the Bongo tows, including the station ID number, transect, region, latitude (°N) and longitude (°W), bottom depth (m), the date and time, target depth (m), tow duration, wire angle (degrees), and volume of ocean water sampled in cubic meters that is calculated from the flow meter readings. Also shown are the dry weights (g) of zooplankton which were standardised to 1,000 cubic meters sampled for the 8.0, 1.7, 1.0, and 0.25 mm size factions as well as for the total sample.

The contact procedure to obtain detail species records from selected plankton sampling stations is available at:

http://www.pac.dfo-mpo.gc.ca/sci/osap/projects/plankton/zooplanktondatabase_e.htm
